The length in codons is given for each CDS.

Usually the highest scoring match found by fasta -o is given for CDS which show significant similarity to other CDS in the database. The position of possible ribosome binding site sequences are given where these have been used to deduce the initiation codon. CAUTION: We may not have predicted the correct initiation codon. Where possible we choose an initiation codon (atg, gtg, ttg or (att)) which is preceded by an upstream ribosome binding site sequence (optimally 5-13bp before the initiation codon). If this cannot be identified we choose the most upstream initiation codon.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Submitted (03-SEP-1999) Yersinia pestis sequencing project, Sanger Centre, Wellcome Trust Genome Campus, Hinxton, Cambridge CBHO 15A E-mail: barrell@sanger ac.uk DNA supplied by Dr. Andrey Karlyshev and Prof. Brendan Wren, [3].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      putative insertion sequence ISIOO, identical to corresponding CDS from Y.pestis KIM5 pCD1 (EMBL:AF053946, AF074612) (340 aa), fasta scores; opt: 2328 z-score: 3808.9 E(): 0, 100.0% identity in 340 aa overlap. Similar to many others e.g. TRAO_ECOLI (EMBL:X14793), istA, E.coli transposase for insertion sequence element IS21 (390 aa) (33.1% identity in 329 aa overlap). Contains Pfam match to entry pF00239 recombinases, Site-specific recombinases, score 25.70, E-value 4.8e-06. Contains probable helix-turn-helix motif at aa 19-40 (Score 2045, +6.15 SD)"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        /gene=
